

Lesson 13

Starting code for the Amazon project: <https://github.com/SuperSimpleDev/javascript-amazon-project>

Git installation instructions: <https://git-scm.com/downloads>

Git and GitHub Full Course: <https://youtu.be/hrTQipWp6co>

We can create almost
all of the website using
just HTML and CSS

JavaScript makes this
website interactive

Git = track changes in our code

```
const products = [{  
  
}]; // this is a list of a  
object . and array represent  
a list
```

```
const products = [{  
  image: 'images/products/athletic-cotton-socks-6-pairs.jpg',  
  name: ' Black and Gray Athletic Cotton Socks - 6 Pairs',  
  rating: { // rating has two property so we use object  
    stars: 4.5,  
    count : 87  
  },  
  price: 10.90  
}]; // this is a list of a object . and array represent a list
```

**JavaScript has problems
doing math with floats:**

```
> 0.1 + 0.2
```

```
< 0.30000000000000004
```

**Best practice when
calculating money:
Calculate in cents**

```
const products = [{
  image: 'images/products/athletic-cotton-socks-6-pairs.jpg',
  name: 'Black and Gray Athletic Cotton Socks - 6 Pairs',
  rating: { // rating has two property so we use object
    stars: 4.5,
    count : 87
  },
  priceCents: 1090
}, // it is the data for first product now another object for 2nd
product
{
  image: 'images/products/intermediate-composite-basketball.jpg',
  name: 'Intermediate Size Basketball',
  rating: {
    stars: 4,
    count: 127
  },
  priceCents: 2095
}
]; // this is a list of a object . and array represent a list
```

Main Idea of JavaScript

1. Save the data
2. Generate the HTML
3. Make it interactive

have on the Page by the way this is called a data structure

structure structures or organizes the data

data and this represents a list of products so we usually use a

to generate the HTML instead of writing the HTML

manually to generate the HTML we can Loop

Loop through this array and for each of these products we're going to

```
products.forEach(); // loop through this array using a for each method
```

```
products.forEach((product)=>{ // inside create a function , pass  
parameter product.  
}); // loop through this array using a for each method
```

```
-----//
```

```
products.forEach((product)=>{ // inside create a  
function , pass parameter product.  
// check korbo product er html code kothai ache.  
otake hover kore then html code e class ta  
search korbo . poro code ta copy korbo  
const html = ``; // ekhane paste korbo  
  
}); // loop through this array using a for each  
method
```

```
products.forEach((product) => { // Inside create a  
const html = `<div class="product-container">
```

```
  <div class="added-to-cart">  
      
    Added  
  </div>
```

```
  <button  
    class="add-to-cart-button  
    button-primary">  
    Add to Cart  
  </button>
```

```
</div>`; // ekhane paste korbo  
// tab press kore indexing thik  
rakhbo
```

```
}); // loop through this array using a for each  
method
```

```
    Add to Cart  
  </button>  
</div>`; // ekhane paste korbo  
// tab press kore indexing thik  
rakhbo
```

```
console.log(html); // kar kore kina check ?
```

```

class="product-image-container">
  
</div>

```

```

class="product-image-container">
  
</div>

<div class="product-name

```

- combine this HTML together

```

search korbo . poro code ta copy korbo
productsHTML += `<div class="product-container">
  <div
    class="product-image-container">

```

```

// this is accumulator pattern. we are adding
result
productsHTML += `<div class="product-container">

```

take this HTML and put it on the page
and

```

<div class="main">
  <div class="products-grid"> <!--We need to
    use dom in here. not the below. becuse
    below are in our loop-->
    <div class="product-container">...
    </div>

    <div class="product-container">...
    </div>

```

```

<div class="main">
  <div class="products-grid
    js-products-grid"> <!--We need to use dom
    in here. not the below. becuse below are

```

```

document.querySelector('js-products-grid')
  .innerHTML = productsHTML; // not worked

```

```

document.querySelector('.js-products-grid')
  .innerHTML = productsHTML; // worked only for
  dot

```

\$10.9

1

\$10.90

```

<div class="product-price">
  $$${(product.priceCents / 100).
    toFixed(2)}

```

The screenshot shows the VS Code interface. On the left, the Explorer sidebar displays a file tree for a project named 'JAVASCRIPT-AMAZO...'. The tree includes folders 'backend', 'data', 'images', and 'scripts'. The 'data' folder is expanded, showing 'JS products.js' (selected), 'amazon.js', and several HTML files. The main editor area shows the content of 'products.js', which defines a 'products' array. The array contains one object for 'Black and Gray Athletic Cotton Socks - 6 Pairs' with a rating of 4.5 stars and 87 reviews. The file is named 'products.js' and is located in the 'data' folder.

```
1 const products = [  
2   {  
3     id: "e43638ce-6aa0-4b85-b27f-e1d07eb678c6",  
4     image: "images/products/athletic-cotton-socks-6-pairs.jpg",  
5     name: "Black and Gray Athletic Cotton Socks - 6 Pairs",  
6     rating: {  
7       stars: 4.5,  
8       count: 87  
9     },  
10    priceCents: 1090,  
11    keywords: f
```

ded a

```
</div>  
<script src="data/products.js"></script>  

```
